# PMI-ACP Exam Simulator

## Free PMI-ACP Exam 2

An agile team is demonstrating a recently developed product.

Who determines when a product is complete?

A    The development team

B    The product owner

C    The sponsor

D    The agile coach

❌ **Question answered incorrectly**

**Hint:**
Who is responsible for providing requirements, specifying acceptance criteria, and consequently accepting the product?

**Correct Answer: B**

**Explanation:**

The team defines the definition of done (DoD), but it is the product owner who accepts the delivered stories as being complete. The DoD is a clear and concise list of requirements that the user story must satisfy for the team to call it complete. The DoD must apply to all items in the backlog. Acceptance criteria, on the other hand, are uniquely defined for each item in the backlog and are used by the product owner to declare a story complete.

**Details for Each Option:**

A    The development team
*Incorrect. The team and the relevant project stakeholders define the definition of done, which applies to every item in the backlog. The team, however, does not determine when a product or a product increment is complete.*

B    The product owner

*Correct. The product owner accepts the completed product increment in the iteration review meeting after reviewing the acceptance criteria and verifying the functionality.*

C    The sponsor
*Incorrect. The sponsor can recommend product backlog items to the product owner, but a sponsor typically does not have the authority to accept or reject a product.*

D    The agile coach
*Incorrect. The agile coach may facilitate the meeting where the product increment is reviewed. Accepting or rejecting the product, however, is not among the agile coach's responsibilities.*

**Body of Knowledge:**

Domain: *3. Product*
Subdomain: *3.4 Manage value delivery*
